PROBLEMS OF CHROMATOGRAPHY

(Symposium in Leningrad)

[Article by Corresponding Member of the AS USSR K. V. Chmutov
and Doctor of Chemical Sciences K. I. Shkodinskii Moscow,
Uchenykh Akademii Nauk SSSR, Russian Federation, No. 10, October

1972, pp. 125-137]

July 1973

A symposium on chromatography, dedicated to the memory
of the outstanding Russian scientist M. S. Tsvet — the founder
of that method, the hundredth anniversary of whose birth was
marked in 1970, was held on 16-18 May in Leningrad. It was or-
ganized by the Scientific Council for Chromatography of the AS
USSR jointly with a number of academic and branch scientific

institutions and VUZ.

Participating in the symposium were over 100 persons
representing all directions of chromatography. Noted for the
first time in such a broad assembly of chromatographers were
the services of M. S. Tsvet in the creation of chromatography,
which has now become an irreplaceable method of separating mix-
tures and investigating the properties of substances. The pro-
gram of the symposium was so compiled that its participants were
able to obtain a concept of the achievements and prospects of
development of the main directions of chromatography.

K. V. Chmutov noted the great contribution of chromatog-
raphy to scientific and technological progress. K. I.
Shkodinskii, in a report entitled "M. S. Tsvet and chromato-
graphy," showed that the discovery of chromatography was a na-
tural stage in the development of science and technology, one
stipulated by the transition to the use of increasingly complex
multicomponent systems. M. S. Tsvet not only discovered the
very fact of separation of a mixture on a layer of sorbent into
the components composing it, but also developed theoretical

ment of more linear chromatograms with different carrier gases. Variants of equilibration procedures, such as the use of a solid adsorbent or particulate and other substances, developed by V. G. Tsvetkov,¹ for gas and liquid chromatography, change of the nature of adsorbents (e.g., silicas), permits realization of the principles of

The third group of reports dealt with applications to determine the selectivity of detection. With it is possible to obtain data on the kinetics of catalytic reactions, to calculate absorption-desorption rate constants, to calculate rates, etc. (cf. Phillips, Bierlaars, et al., *Proceedings of the International Congress on Industrial Hygiene*, 1951). Of exceptional interest is the promising technique of human metabolism. The determination of gases, organic and inorganic, and of metabolites of steroids, sugars, in extracts of various organs of the course of disease (Holland) showed the possibilities of change of vital graphy to determine concentrations of applying for detection of harmful substances in the environment — waters and in the air near industrial enterprises, incinerators in forests, etc.

Solemn unveiling of plates in the symposium were present at the
honoring of a memorial plaque honoring H. S. Tsvel'att
scientist lived and worked Soviet physiologist who

In summing up the results of the symposium it is convincing to demonstrate the high level of development of the practical problems being solved by means of chromatography and the development of theoretical investigations showed the need for further development of computer. For substantial investigations, especially with the use of work on the creation of new solvents with a broad development of molecular properties and the possibility of assuring complete separation systems with high selectivity and sensitivity.

"Single-Band Modulation in a Quasi-Optical Strip"

Moscow, Radiotekhnika, No 9, 1972, pp 7-11

Abstract: This article is based on an Author's Certificate, No. 251034, credited to the two authors mentioned above, in which a polarization phase shifter with reflecting phase sections in the form of wire grids was proposed for a quasi-optical transmission line. The present paper considers the application of this phase shifter to single-band modulation. A cross section drawing of the device is given together with an explanation of its operation. An expression is given for the phase shift in terms of the phase shifter's parameters, and it is noted that this expression is more complex than the waveguide type of polarization phase shifter. An expression is also obtained for its output spectrum, and a table of the amplitudes for the useful signal components in the spectrum is presented. The results of measurements of the phase shift on a Michelson interferometer are given together with an explanation of how these measurement were made. It is noted that the device does not set up a back reflection in the transmission line.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE CHANGES WERE TRACED OF OXYGEN TENSION IN ARTERIAL BLOOD AND SKELETAL MUSCLE, OF BLOOD PRESSURE, RESPIRATION, BODY TEMPERATURE CONCENTRATION OF THE HYDROGEN IONS IN BLOOD AND OTHER INDICES OF THE ORGANISM FUNCTIONAL STATE DURING THE DROWNING OF DOGS IN SALT WATER AND THEIR FOLLOWING REANIMATION. CLINICAL DEATH, COMING FROM THE LAST MOVEMENT OF THE THORAX, LASTED FROM 9 MIN 36 SEC UP TO 21 MIN. REANIMATION OF THE DROWNED ANIMALS WAS CARRIED OUT BY THE METHOD OF ARTIFICIAL BLOOD CIRCULATION ACCORDING TO S. S. BRYUKHONENKO OR ACCORDING TO A VARIANT OF THIS METHOD, USING A PUMP OF AUTOJECTOR AND A DONOR (LIVING ORGANISM). THE DIFFERENCE IS SHOWN IN THE DYNAMICS OF PO SUB2 CHANGES IN ARTERIAL BLOOD AND SKELETAL MUSCLE. IT DECREASES IN BLOOD QUICKER THAN IN THE MUSCLE WHEN SUBMERGING AN ANIMAL INTO WATER, AT THE SAME TIME DURING REANIMATION, AFTER PROLONGED CLINICAL DEATH, PO SUB2 IN THE SKELETAL MUSCLE REACHES CONSIDERABLE VALUES WITH RECOVERY OF RESPIRATION AND HEART ACTIVITY, IF THE BLOOD FLOW RATE IS HIGHER THAN 100 ML-KG-MIN. DATA ARE OBTAINED EVIDENCING FOR A RELATIVELY QUICK LIQUIDATION OF BLOOD ACIDOSIS, AS WELL AS FOR THERMOGENESIS INTENSIFICATION. AFTER SWITCHING OFF THE EXTRACORPORAL BLOOD CIRCULATION, AS A RULE THE FREE OXYGEN CONCENTRATION IN THE MUSCLE DROPS. IT MIGHT BE A REASON FOR PUTTING THE REANIMATED ANIMALS INTO CONDITIONS OF THE Elevated OXYGEN PRESSURE.

ABSTRACT. THE DURATION OF REFRACTORY PERIOD OF 75 NEURONS IN THE CAT'S AUDITORY CORTEX ACTIVATED BY A CLICK WITH A LATENT PERIOD NOT MORE THAN 30 MSEC. WAS STUDIED BY THE PAIRED CLICK METHOD. THE INVESTIGATION WAS PERFORMED ON CATS UNDER D TUBOCURARINE. 68 UNITS HAD NO SPONTANEOUS SPIKE ACTIVITY, IN 7 NEURONS IT WAS RARE AND IRREGULAR. IT WAS FOUND THAT THE CONDITIONING CLICK PRODUCED IN ACTIVATED UNITS THE STATE OF PROLONGED REFRACTORINESS TO THE TESTING REFRACTORY PERIOD OF EACH UNIT WAS CONSTANT, BUT IT VARIED IN DIFFERENT NEURONS. A DEPENDENCE WAS FOUND BETWEEN THE NUMBER OF CELLS ACTIVATED BY THE TEST CLICK AND INTERCLICK INTERVAL. WHEN THE INTERVAL BETWEEN TWO CLICKS BECAME SHORTER THE NUMBER OF NEURONS ACTIVATED BY THE SECOND CLICK DECREASED. IT WAS SUGGESTED THAT SUCH INTERRELATIONSHIP MIGHT BE A NEUROPHYSIOLOGICAL MECHANISM OF SHORT TIME INTERVAL PERCEPTION DISCRIMINATION.

"Detection of a Point Signal in Noise for Images of Discrete Structure"

Novosibirsk, Avtometriya, No 6, 1971, pp 42-52

Abstract: In the photographic recording of small objects of low brightness, as in the registration of weak stars or laser location of the moon, a method of increasing the sensitivity of the recording equipment is through an electronic-optical converter. Since the use of high-gain converters in such recording systems involves substantial difficulties because of the limitations in the dynamic range of the photomaterial used as the memory device, the authors of this article analyze the possibilities of the traditional method of single-frame memory and propose methods for broadening these possibilities. Multiframe memory is also discussed. Experiments are described to determine the probability of detection of the point signal in noise, and a description of

"Periclase-Spinel Refractories Made of Natural-Brine Magnesium Oxide and Concentrated Chromite"

Moscow, Ogneupory, No 9, 1971, pp 35-40

Abstract: Periclase-spinel refractories made of pure materials (brine magnesium oxide and kimpersayskiy chromite) are compared with the corresponding refractories made of ordinary-grade magnesium oxide and chromite. Experimental articles fabricated in the test comparison were 230 x 115 x 65 mm in size and were molded on a hydraulic press at a pressure of 1200 kg/cm². For articles made from ordinary grade materials, silicate impurities were found to clearly affect compaction. In contrast, a high temperature for the onset of deformation under load (upwards of 1750°) was found to characterize articles made of brine magnesium oxide and concentrated kimpersayskiy chromite. These articles showed less linear (at a load of 2 kg/cm²) and less additional (10 hr at 1750° exposure) shrinkage. The microstructure of articles made from pure materials showed a sizable fraction of periclase bonds not across silicates, but across secondary spinel. Two illustrations: six tables.

Riga, Izvestiya Akademii Nauk Latviyskoy SSR, Seriya Khimicheskaya, No 2, 1972, pp 163-166

Abstract: The spectrophotometric method was used to determine the ionization constants of thiocarbonylic groups in α -furandithiocarboxylic acid ($pK_{CSSH} = 2.04$) and dithiopiperonylic acid ($pK_{CSSH} = 2.29$). Using radioactive isotopes, the authors studied the time dependence of the degree of extraction of zinc, nickel and trivalent iron compounds, with tetraphenylphosphonium salts of α -furandithiocarboxylic acid, dithiopiperonylic acid and 2-hydroxydithiobenzoic acid serving as reactants. It was found in all cases that equilibrium is reached slowly due to the hydrophobic nature of the tetraphenylphosphonium ion.

"Bone and Blood Vessel Prostheses"

Riga, Nauka i Tekhnika, No 8, 1971, pp 25-29

Abstract: Scientists in the field of biomechanics are directing research toward determining the elasticity, deformative properties, and strength of blood vessel walls and bone tissue, and how they change with age and under stress. The possibilities of producing synthetic materials as effective as natural tissue are being investigated, as well as the improvement of prostheses. Blood vessel prostheses are emphasized because of the high incidence of atherosclerosis. Corrugated lavsan prostheses are most widely used in the USSR. Special stretching machines are used to test the ability of reconstructed arteries to withstand arterial pressure; the results are implemented in practice. Experiments are being made to overcome hardening and stoppage in long, narrow prostheses by combined prostheses which reinforce part of the reconstructed artery or vein. A new method of cultivating prostheses in living tissue has been tested on animals, but the practical value of this process is unknown. Experiments are in progress to define the disintegration process of arterial walls in cases of closed trauma. Research on bones is chiefly directed toward studying deformative properties and stability. No adequate substance has yet been found for bone prostheses. Metal or alloys

1/2

USSR

KENTS, IVAR, et al., Nauka i Tekhnika, No 8, 1971, pp 25-29

are unsatisfactory because they do not adapt to the cyclical stress which seems to play a crucial role in bone nourishment.

"The Effect of the Mesencephalic Reticular Formation on Spatial Synchronization of Brain Potentials"

Moscow, Zhurnal Vysshoy Nervnoy Deyatel'nosti imeni I. P. Pavlov, Vol 23, No 1, Jan/Feb 73, pp 159-165

Abstract: In rabbits, electrical stimulation (100-150 c/sec, 3-7 V, 0.5-1 msec impulses) of the mesencephalic reticular formation either reduces (23% of the animals) or enhances (69%) spatial synchronization of brain cortex potentials. In the latter case, two periods of maximum synchronization occur: the first in 1-5 min and the second in 10-15 min. Stimulation of the reticular formation also increases spatial synchronization of the potentials of subcortical structures and of formations located between the subcortical structures and the cortex. During the periods of maximum synchronization in the cortex, the subcortical and cortical potentials become very similar, and this similarity is evidently one factor causing the synchronization peaks.

"Stepwise Combustion of the Propane-Air Mixture in a Tube"

Moscow, Zhurnal Fizicheskoy Khimii, Vol 46, No 3, Mar 72, pp 762-764 .

Abstract: During the combustion of a propane-air mixture in a vertical hermetically sealed tube, 65 mm in diameter and 4850 mm long, initially a slow increase in pressure was observed until a maximum was reached. Then the pressure dropped, to be followed by a sharp jump. On the basis of the "phased" character of flame expansion in a closed volume, it may be assumed that the mechanism of combustion is a complex thermal chain mechanism, in which concurrently with heat evolution a phase of an elementary act of autocatalysis takes place.

"An Open-Cycle MHD Electric Power Plant Based on Natural Gas With Chemical
Regeneration of Exhaust-Gas Heat"

Teplotekhn. Probl. Pryamogo Preobrazovaniya Energii /Heat Engineering Problem
of the Direct Conversion of Energy -- Collection of Works/, No 4, Kiev, Nauk.
Dunika Press, 1973, pp 10-19 (Translated from Referativnyy Zhurnal Turbostroyeniye,
No 11, 1973, Abstract No 11.49.153)

Translation: Results are presented from analysis of various factors: magnetic
induction B, quantity of additive, end effects and air heating temperature on
the thermodynamic effectiveness η_{st} of an MHD electric power plant (MDEPP)
with a frame channel of the MHD generator and a steam turbine and thermochemical
processing of the fuel (water conversion) using natural gas as the fuel. Cal-
culations of the MHD power plant are presented for a consumption of combustion
products of 2000 kg/sec using two types of magnetic system (MS): nonsupercon-
ducting and superconducting. For the nonsuperconducting MS, η_{st} of the
MDEPP changes within limits of 50-42% and 51-52% as B is changed from 5 to

6.5 T at air temperatures of 1100 and 1500°K respectively. For a superconducting MS with B=6 T with a power plant capacity of 2500 Mw, η_{st} increases by 3.5-6.5% as air temperature is increased from 1100 to 1500°K. It is established that the presence of end sectors causes an increase in total length of the MHD generator and an increase in losses to cooling, reducing η_{st} . Injection of K_2CO_3 with 1 wt. % K decreases η_{st} by 1.5%. Problems of water conversion of methane are studied. It is concluded that the MHD power plant discussed is quite promising. 5 Figures; 13 Biblio. Refs. M. I. Osipov

Magnitogidrodinamicheskiye Generatory (Magnetohydrodynamic Generators),
Izdatel'stvo Nauka, Moscow, 1972, 424 pp

Translation of Foreword: The MHD power generation problem is one of the leading in power engineering because this method of electrical energy production has many economical and technological advantages. The most detailed studies of MHD have been carried out in the USSR and USA where experimental units operate on combustion products with potassium additives. A powerful MHD generator at the Institute of Power Engineering imeni G. M. Krzhizhanovskiy can be mentioned as an example. Designing and building of this generator, as well as of many others, especially those operating on liquid metals, were preceded by many studies that lasted for many years. The authors of this book contributed substantially to the design of the above MHD generator.

The many technological difficulties encountered in MHD power generation on an industrial level should not weaken the efforts of researchers because MHD generators are the most promising means for energy conversion, and they are capable of producing electrical power comparable to convenient power plants.

1/11

- 43 -

USSR

YANTOVSKIY, YE. I., and TOLMACH, I. M., Magnetohydrodynamic Generators,
Izdatel'stvo Nauka, Moscow, 1972, 424 pp.

If we trace back the historical development of the gas turbine, which can be roughly compared with the MHD generator, we can distinguish three basic stages: designing the turbine by P. D. Kuz'minskiy in 1892, application of gas turbines in the aviation industry in 1945, and completion of the powerful gas turbine power station at the Krasnodar Thermoelectric Power Plant in 1970.

Analogously with gas turbine development, it can be predicted that a powerful MHD power generating plant will be built not sooner than 15-20 years from now, provided the new energy production method is actively pursued in the future. The design of the U-25 experimental industrial pilot unit by the Institute of High Temperatures of the Academy of Sciences USSR was an important step in the right direction.

It is quite possible that MHD generators will appear much sooner as sources of energy for space research.

This book should occupy an important place among numerous publications devoted to individual aspects, as well as to the general MHD problem, because of a systematic and broad coverage of theoretical problems combined with the design aspects of the MHD generators.

2/11

USSR

YANTOVSKIY, YE. I., and TOLMACH, I. M., Magnetohydrodynamic Generators,
Izdatel'stvo Nauka, Moscow, 1972, 424 pp

As a result of long-lasting research on the subject, the authors formed a definite point of view regarding the advantages of MHD generators operating on combustion products (loop-type). Liquid metals will be best suited for alternating current generators. The final selection of the type of generator will be decided by experiments.

This book will be of interest to researchers, engineers, and students because it covers broad aspects of hydrodynamic generators and presents definite conclusions about each topic.

"Study of the Commutation of a Strong Direct Current Using a Molten Metal
in a Rotating Magnetic Field"

Riga, Magnitnaya Gidrodinamika, No 4, Oct-Dec 72, pp 95-101

Abstract: A unit for studying the commutation of strong currents with the aid of molten metal is described which consists of a non-conducting, hermetically sealed cylinder partially filled with molten metal, electrodes inserted inside the cylinder and an external nonferrous inductor of the rotating field. When the inductor is switched on the molten metal is uncoiled and forms a rotating and conducting cylinder and closes the main circuit. Switching the inductor off leads to the fall of molten metal from the force of gravity and to a break in the circuit. Questions of comparing the linear device with centrifugal devices, determination of the maximum current of short circuiting and calculation of the nonferrous stator field are discussed. Experiments are described on a model of a switch with commutations of direct current up to 1000 a and a voltage of 220 v with forcing of the control voltage

"Influence of Gamma-Quantum Bombardment on Temperature Coefficient of Linear Expansion of Solid Solutions in the System KCl-KBr"

Izv. Tomsk. Politekhn. In-t [News of Tomsk Polytechnical Institute], Vol. 184, pp. 40-51, 1970 (Translated from Referativnyy Zhurnal Fizika, No. 11, 1970, Abstract No. 11 Ye 1093 by Yu. Nikolayev)

Abstract: The influence of isodosic bombardment of gamma-quanta on the temperature coefficient of linear expansion (α) of solid solutions in the KCl-KBr system is studied as a function of composition of the solution, and the influence of a bombardment dose on α of solid solutions of various compositions is also investigated. Measurements were performed using a capacitive dilatometer by the Beat method with an accuracy of $\pm 10^{-7}$ deg $^{-1}$. It is demonstrated that after bombardment, α of solid solutions increases less than α of pure crystals. As the bombardment dose increases, the concentration of radiation-induced defects increases more

"Concerning S. N. Bernshteyn's Stochastic Bridges"

Vestn. Khar'kov. un-ta (Khar'kov University Herald), 1972,
No 83. Mathematics and Mechanics, vyp. 37, pp 77-85 (from
RZh-Kibernetika, No 8, Aug 72, Abstract No 8V105)

Translation: In a paper at the International Congress on Relations Between Random Quantities held in Zürich in 1932, S. N. Bernshteyn introduced a new class of random processes -- stochastic bridges (recurrent chains) -- which are a generalization of Markov Processes. In finding the laws of probability distribution for stochastic bridges, it is necessary to set not only the initial distribution, but also the final distribution. In this paper, relations are established between stochastic bridges, stochastic differential equations, and the corresponding equations for probability distribution densities, and several examples are considered. Translation: The method of parabolic equations is frequently used in studying high order stochastic differential equations. However, this method is based on expanding the phase space and reducing the corresponding problem to the Markov case. But such a course is not always advisable if we are interested in the probability distribution densities of solution of the initial stochastic differential equations rather than in the joint probability distribution densities of the solution and its derivatives.

In this paper, the "inverse" problem is considered: relations are postulated between the "probability" flow and the

"Strength of Ultralight-Weight Refractories"

Moscow, Ogneupory, No 2, June 72, pp 43-47

Abstract: The Institute for Physical and Technical Problems, Academy of Sciences Lithuanian SSR has designed, built, and adapted for practical application an LV-1 set-up for testing the tensile, compressive, and bending strength of ultralight-weight refractories at temperatures up to 1200°C. A BV-662 inductance pickup is used for both measuring and recording the deformation values for the latter two types of stress tests. The test materials were SHLB-0,4 and SHLB-0,6 ultralight-weight refractory bricks. Curves are shown to illustrate the strength values of the bricks as a function of temperature and apparent density. There is only a slight variance in strength values up to 700-800°C. At 900°C there is a marked increase in strength for all types of load tests. At 1000-1100°C and higher

"Interference Method for Measuring Hole Diameter Using Certified Internal Gages"
Moscow, Izmeritel'naya Tekhnika, No 9, 1970, pp 33-36

Abstract: A method is described for measuring the diameter of holes in ring gages made from transparent material such as glass or quartz. The method consists of using interference bands for determining an equal thickness of the dimensional difference of the ring gage and the certified internal gage placed within the ring gage. The error of the special internal gage does not exceed 0.07 microns. The measurement error of the method does not exceed 0.1 microns. "Measurement of Openings by the Absolute Interference Method"
Moscow, Izmeritel'naya Tekhnika, No 10, Oct 70, pp 22-25

Abstract: A description is given of a method for measuring openings in ring gages made of transparent material. This method, developed by the KhGNIIM (Khar'kov State Scientific Research Institute of Metrology), consists in determining the diameters of the openings by direct comparison with the length of light waves emitted by monochromatic light sources. Results of theoretical and experimental research on the accuracy of this method show that it is the most accurate of all known methods for measuring diameters of openings, having an error not greater than 0.05 microns. 2 figures, 6 bibliographic entries.

"Effect of Gigantic Laser Pulses on the Microstructure of Aluminum"

Moscow, Fizika i Khimiya Obrabotki Materialov, No 4, Jul-Aug 73, pp19-21

Abstract: An electron microscope study was made of defect formation in aluminum under the effect of gigantic laser pulses where the aluminum had a purity of 99.99%. Disk samples, 50 microns thick, were vacuum annealed at 600°C for four hours prior to laser bombardment. After annealing, the samples were placed on a glass plate in distilled water and bombarded with laser pulses at room temperature. Bombardment was done in three modes -- I, II, III, determined by the level of laser pumping, with mode III being the maximum radiation capacity. The study showed that structural damage results from laser exposure where the nature and degree of sample damage depended on the mode of irradiation and the distance of the investigated section from the crater epicenter. High concentrations of dislocation loops were found in samples for all three modes with the densities amounting to $10^{14}/\text{cm}^3$ for mode I, $5 \cdot 10^{12}/\text{cm}^3$ for mode II, and $7 \cdot 10^{13}/\text{cm}^3$ for mode III.

Nikiforov, Yu. N., V. A. Vinushkevich,
and A. V. Sandulova. Change in electrical
properties of p-Si crystal whiskers from
the action of ultrashort laser pulses. FizKhim.
no. 3, 1972, 132-134.

Laser-induced change in the resistivity ρ of p-Si
whiskers is described. The whiskers were grown along the [111]
axis, had a hexagonal cross section, and ranged in length from 3
to 7 mm. Specimens were exposed to 50 nanosecond pulses from
a ruby laser, with the laser beam normal to the crystal axis. Impact
densities were varied over several tens of joules/cm², up to the damage
threshold which was in the range of 35-45 J/cm². The data are presented
as resistivity variation $\Delta R/R_0$ in exposed specimens as functions of whisker
geometry, ambient temperature and initial ρ . Typical results at an exposure
of 22 J/cm² show a sharp rise in R by about 12-15%, followed by an exponential
decay back to about the initial value, at a time constant ≈ 20 milliseconds.
Of the possible mechanisms considered for the alteration effect (photocell effect,
crystal heating, piezoeffect, defect formation) it is shown that point defect
formation is the most probable factor. Defect levels, estimated to reach
 $10^{17}/\text{cm}^3$, were effectively annealed out in all cases in 30 milliseconds or less.

YANUSHKYAVICHUS, Z., Academician, Academy of Sciences Lithuanian SSR

"The Heart and Its Automatism"

Riga, Nauka i Tekhnika, No 12, 1972, pp 33-38

Abstract: In 1970 an institute for the study of the physiology and pathology of the cardiovascular system was founded at the Kaunas Medical Institute. This institute became one of the leading centers in the world dealing with such problems, and is one of the three in Europe (the other two are located in Zagreb and Rotterdam). Thus far, seven of the staff members have been awarded Republic Prizes, and three staff members have been awarded the USSR State Prize. The studies conducted at the institute deal with the genesis of the innate rhythmicity of the heart, and the various factors -- endocrine and nervous -- that regulate it to satisfy the physiologic needs of the body under different conditions. The heart, which accounts for only 0.4-0.5% of the total body weight, consumes 6-10% of the oxygen taken up by the body, and this is made possible by the fact that the number of capillaries per unit of myocardium are as twice as great as in other muscles. Any factors that decrease the supply of oxygen to the myocardium severely compromise its function, and frequently lead to

1/2

USSR

YANUSHKYAVICHUS, Z., Nauka i Tekhnika, No 12, 1972, pp 33-38

ventricular fibrillation -- a type of contractile activity that does not pump blood throughout the body. One of the methods of restoring normal activity in this case consists of stimulation of the heart with a high voltage current. In 1970, as a result of their work and contribution to this problem two of the members of the staff were among those honored by the USSR State Prize, Professor A. Smaylis and Dr. A. Lukashevichute. A new instrument has been constructed at the institute, the rhythmograph, which can give an accurate recording of the heartrhythm over prolonged periods of time. By means of this instrument, changes in the activity of the heart can be detected which are not apparent by other techniques. Although as yet the mechanism of the innate myogenic rhythmicity of the heart has not been elucidated, the initial steps have been taken and it can be expected that in the not too distant future clinicians will be able to utilize this phenomenon, along with its regulatory factors, in the treatment of heart diseases.

the dimensions of the active components, the influence of the dimensions being more significant as the required power of the circuit is less. The authors study the influence of the capacitance of the emitter junction of a microemitter transistor on the speed of response of the TIL of the circuit.

The article contains 6 figures, 2 tables, and 4 bibliographic references.

Basic Ways of Increasing the Quality of Logic Integrated Microcircuits. Ivanushkin, S.S. In the Collection Mikroelektronika, edited by I.V. Lurkin, No 5, p 110, Sovetskaya Radio Publishing House, 1972.

This article defines the functional relationship between the product PT and other physical parameters of size, bounded by an arbitrary surface. On the basis of the obtained dependence the article discusses ways of increasing the speed of response and decreasing the scattering power of the logic integrated microcircuits.

The article contains 2 bibliographic references.

UDC 621.396.6-181.5
Use of Nonlinear Programming for Optimal Computation of the Geometric Dimensions of the Regions of Transistors of Integrated Circuits. Kazennov, G.G., Butakov, B.V., Lebedenko, A.V., and Rudenko, A.A. In the Collection Mikroelektronika, edited by I.V. Lurkin, No. 5, p 118, Sovetskaya Radio Publishing House, 1972.

A method is suggested for solving problems of synthesizing active components based on the use of nonlinear programming equipment. The article gives a block-diagram of the program algorithm and a specific example of the optimal computation of the geometric dimensions of the regions of the transistor for an integrated semiconductor circuit.

The article contains 4 figures, 1 table, and 8 bibliographic references.

"Equations of a Multichannel Band Filter"

Techn. kibernetika, Tekhn. kibernetika (Technical Cybernetics), Kaunas, 1970,
pp 263-269 (from RZH-Radiotekhnika, No 8, Aug 70, Abstract No 8A118)

Translation: This article contains an investigation of a system comprising two modulators, low-frequency filters and a summator. The signal multiplied by the time function of the first modulator goes through the low-frequency filters to the second modulator. The signals multiplied by the time function of the latter are summed. It is demonstrated that the given system is a band filter with a central frequency equal to the modulation frequency and not depending on the errors and instability of the low-frequency filter parameters and with strictly symmetrical shape of the pass band with respect to the midband frequency. There are four illustrations and a four-entry bibliography.

"Spontaneous Pulsating Activity in the Cat Visual Cortex During Asphyxia"
Leningrad, Fiziologicheskiy Zhurnal SSSR imeni I. M. Sechenov, Vol 58, No 11,

1972, pp 1656-1662

Abstract: Action potentials were recorded from the surface of 60 neurons of the visual cortex (trephined occipital bone) in anesthetized and curarized cats. As long as the animals were on artificial respiration, the neurons discharged single or multiple spike potentials at rates of 1-57 impulses/sec. Upon disconnection from the respirator, no changes were observed in the first 5-10 sec. With hypoxia developing, the rate of discharge increased by a factor of 8-10 for a duration of 5-90 sec. Then the rate and amplitude of the spike potential decreased, and all activity ceased in 15-329 sec of asphyxia. Neurons with an initial discharge rate of 11-15 impulses/sec preserved their activity for the longest period, while those with an initial rate of 1-5 were the first to become silent. EEG activity outlasted that of individual visual neurons. It is pointed out that the changes in the discharge rate caused by asphyxia are similar to those caused by cathodic depression: a partial depolarization of the neurilemma by up to 15 mV facilitates generation of action

"An Electromechanical Band Filter"

USSR Author's Certificate No 257635, filed 28 Dec 67, published 20 Nov 70
(from RZN-Radiotekhnika, No 6, Jun 71, Abstract No 6V437 P)

Translation: An electromechanical band filter is proposed which contains a T-shaped resonator which operates in the flexural vibration mode, one permanent bar magnet and input and output electromagnetic converters, the ends of the resonator fitting in the converter gaps. To simplify manufacture of the filter, the base of the T-shaped resonator is fastened to a support which is not connected to the magnetic circuit of the filter, and the ends of the permanent magnetic are directly connected to the magnetic circuits of the input and output converters.

"A Method of Determining the Quality of Rod Fastening"

USSR Author's Certificate No 281674, filed 9 Jun 69, published 29 Dec 70
(from RZh-Radiotekhnika, No 6, Jun 71, Abstract No 6V440 P)

Translation: A method is proposed for determining the quality of rod fastening, e. g., cantilever fastening of the resonators in electromechanical filters. The procedure is based on setting up mechanical forces in the rod to be tested. To improve the accuracy of measurement precision, a standard specimen made in the form of a two-rod fork with rods having identical resonance frequencies is fastened in a manner analogous to the rod to be tested, mechanical oscillations are excited in one of the rods, the amplitude of the oscillations in the second rod is measured, and the quality of the fastening (compliance of the joint) is determined from the amplitude ratio of the oscillations in the rods.

"A Method of Controlling the Temperature Coefficient of Frequency of Metallic Radio
Engineering Articles"

USSR Author's Certificate No 253255, Filed 28 Dec 67, Published 24 Feb 70 (from
RZh-Radiotekhnika, No 10, Oct 70, Abstract No 10Y386 P)

Translation: This Author's Certificate introduces a method of controlling the temperature coefficient of frequency of metallic electronic parts such as the resonators in electromechanical filters. The procedure is based on controlling the physical parameters of the parts. As a distinguishing feature of the patent, the range of variation in the temperature coefficient of frequency is extended by case hardening the given part to shift the temperature coefficient of frequency toward more positive values. Roller treatment may be used for case hardening. On the other hand, the temperature coefficient of frequency is shifted toward more negative values by softening the surface layer, for instance by electropolishing.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. EXCERPTS: "...THE COORDINATING COMPUTER CENTER WILL PROCESS INCOMING INFORMATION". A ROUTINE REPORT ON A NEW INVASION OF MAN INTO SPACE USUALLY CONCLUDES WITH A PHASE LIKE THIS. THE MEANING CONCEALED IN THIS SENTENCE IS NOT ALWAYS COMPLETELY REALIZED. MEANWHILE, SUCCESSFUL SPACE EXPERIMENTS WOULD NOT BE POSSIBLE WITHOUT COMPUTERS. ON 15 SEPTEMBER 1968, THE SOVIET UNION LAUNCHED THE AUTOMATIC STATION "ZOND 5" TOWARDS THE MOON. FOLLOWING ORIENTATION IN SPACE, WHICH WAS CARRIED OUT WITH HIGH PRECISION, THE PROGRAMMED DEVICE GAVE THE COMMAND WHICH SWITCHED ON THE LAST STAGE OF THE CARRIER ROCKETS, PERMITTING THE STATION TO BE SENT OUT IN THE DIRECTION OF THE FLIGHT TO THE MOON. AT A DISTANCE OF APPROXIMATELY 325,000 KILOMETERS FROM THE EARTH, THE ON BOARD AUTOMATIC CONTROL SYSTEM HELPED CARRY OUT THE STATION'S PROGRAMMED TURN INTO THE INITIAL POSITION FOR TRAJECTORY CORRECTION. THE DATA NEEDED TO MAKE THE CORRECTION WAS PREPARED BY THE COMMAND MEASURING COMPLEX AND TRANSMITTED ON BOARD THE STATION. "ZOND 5" WAS TRANSFERRED TO A NEW FLIGHT TRAJECTORY WHICH IMPROVED ITS FLIGHT AROUND THE MOON. THE STATION FLEW AROUND THE MOON AT A DISTANCE OF APPROXIMATELY 2,000 KILOMETERS, CONDUCTING RESEARCH ON THE PHYSICAL CHARACTERISTICS OF THE SPACE NEAR THE MOON DURING THIS TIME. DURING "ZOND 5"'S APPROACH TO THE EARTH, ITS TRAJECTORY WAS SUBJECT TO A SECOND CORRECTION IN ORDER TO INSURE AN EXACT APPROACH TO THE EARTH'S ATMOSPHERE. THE CALCULATED WIDTH OF THE "ENTRY CORRIDOR" IS 10-13 KILOMETERS, WHEREAS THE AVERAGE DISTANCE TO THE MOON IS EQUAL TO 384,395 KILOMETERS.

"The Bounds of Error Probability for Analog Decoding in Gaussian Channels"

Tashkent, v sb. Vopr. kibernetiki (Problems in Cybernetics --- collection of works), No 45, 1971, pp 156-180 (from RZh-Matematika, No 6, 1972, Abstract No 6V361)

Translation: Words in a binary code (n,k) with an alphabet $(1,-1)$ and a minimum Hamming distance d_{\min} are transmitted along a semi-continuous channel with additive noise having a Gaussian distribution $(0, \sigma^2)$. The upper bounds of the decoding error probability for optimum reception "as a whole" are determined. A comparison is made of the decoding error probability for the given code in reception "as a whole" and in "element by element" reception.

"Measuring Semiconductor Diode Loss Resistance"

Moscow, Pribory i Tekhnika Eksperimenta, No. 3, 1971, pp 145-147

Abstract: The loss resistance, usually designated r_s , is one of the semiconductor diode parameters determining the frequency range of the diode. This article describes an instrument for measuring this quantity which overcomes the defect of an earlier device for the same purpose by using a peak detector instead of the low-frequency filter used in the earlier system, thus increasing the signal obtained from the diode under test. A block diagram of the new system plus a schematic are given, together with an explanation of its operation. The instrument can be used for measuring the loss resistance in tunnel diodes and in varactors biased in the forward direction. The authors are associated with the Tomsk Polytechnical Institute.

"Determination of the Initial Reaction of a Concial Shell to a Pulse Load"

Kiev, Prikladnaya Mekhanika, Vol 7, No 8, 1971, pp 111-114

Abstract: A solution describing the initial period of deformation of a shell is constructed on the basis of the equations for a round conical shell within the theory of Timoshenko. Use of expansions of the desired functions in Fourier-Bessel and Dini series provides accurate satisfaction of the boundary conditions. The proposed method may be used for determining the initial reaction of a concical shell to an arbitrary axially symmetric load, ten terms in the series yielding an error of not more than 5%. Three references.

"On Errors in Practical Spectral Analysis Under a Fourier Transformation of the Correlation Function"

Tr. metrol. in-tov SSSR (Works of the Metrology Institutes of the USSR), 1971, No. 126(186), pp 78-82 (from Referativnyy Zhurnal, Metrologiya i izmeritel'naya tekhnika, No 11, Nov 71, Abstract No 11.32.77)

Translation: Errors in the spectral analysis of stochastic processes that are introduced by a Fourier transformation of the correlation function are discussed. It is shown that errors in the correlation function from the aspect of their effect on the result of the spectral analysis should be separated into local and global errors. "Parasite" oscillations appear in the spectral density under a local error in the correlation function. With a global nature of errors in the correlation function, when the error function can be expanded in Fourier series in the interval of definition, local "pips" corresponding to the expansion harmonics occur in the spectral plane. These results make it possible to determine points of the correlation function at which the greatest errors occur. The general expression is also obtained for the error of the spectral density on the assumption of continuity of the error of the correlation function; possible errors in the spectral analysis for known errors in the correlator can thus be evaluated. 3 ref.

Tr. metrol. in-tov SSSR (Works of Metrology Institutes of the USSR), 1970,
vyp. 117 (177), pp 109-117 (from RZh-Radiotekhnika, No 2, Feb 71, Abstract
No 2A391)

Translation: The authors describe the functional circuit of a generator of random signals in the 0.01-30 Hz range with a shaper for the form of the correlation function $R(\tau)$. Random signals in the above mentioned frequency range are produced by the method of converting noise to a generalized telegraph signal with subsequent filtration by low-frequency filters. These filters double as the correlation function shaper. The maximum error in shaping $R(\tau)$ is calculated. Four illustrations, bibliography of nine titles. Resumé.

DISCOVERY OF PI-MESON REPORTED AT DUBNA INSTITUTE

[Editorial Report--L] Moscow SOCIALIST INDUSTRY of 5 March 1970 publishes [a report by TASS correspondent A. Vrenyakov entitled "The Discovery of the Secret of Pi-meson." The report describes how, experimenting on a synchrocyclotron at the Dubna Joint Nuclear Research Institute, "Soviet physicists have accomplished the previously unknown transformation of a positive meson into a negative one. The reaction can be reversed from a negative meson to a positive one."]

The report continues: "This research by physicists Yu. A. Batunov, S.A. Bunyatov, V.M. Sidorov, and V.A. Yarba, was examined on 3 March and acknowledged as an outstanding scientific discovery at a session of the USSR Council of Ministers Committee for Inventions and Discoveries."

"The Soviet physicists' discovery," the report continues, "is of enormous theoretical importance. Thus, in the opinion of scientists, with the help of the newly discovered reaction of pi-mesons a search for new atomic nuclei can be conducted."

42
19741816
19

AP0040374.

Recently, the report says, research scientists have been interested in the possibility of the existence of "multineutron systems" and even of "neutron drops." The Soviet physicists' latest work "has made it possible to investigate this extremely interesting problem under laboratory conditions." The scientists are now investigating the effect of the "double recharging" of pi-mesons. They are being aided in their research by physicists from Bulgaria, Mongolia, and Romania.

"Determination of the Stressed State of a Disk Weakened by a System of Cracks"

L'vov, Fiziko-Khimicheskaya Mekhanika Materialov, Vol 9, No 4, 1973, pp 75-81

Abstract: A survey of works is given on the plane problem for a disk with a crack. A disk is examined which has N arbitrarily directed straight-line cracks under an arbitrary load (in particular, stresses, applied to the opposite edges of the cracks, are assumed to be unequal). The problem is reduced to a solution of a system of integral equations which, in the case of internal cracks, can be transformed to a system of second-order integral equations. Partial cases and methods of solving the equations are discussed. 20

"Stressed State of a Disc with a Diametral Crack"

Fiziko-Khimicheskaya Mekanika Materialov, Vol 8, No 2, 1972, pp 69-78

Abstract: A solution of the integral equation of the symmetric problem in the form of a series with respect to λ (λ is the crack length reduced to the disc diameter) is found for a disc with a central diametral crack with arbitrary symmetric and antisymmetric loads. Formulas are also found for determining the stress intensity coefficients with accuracy to terms of order λ^{12} . Graphs are presented showing the variation of the critical value of concentrated normal and tangential forces as a function of the crack length and the variation of the corresponding distributed loads.

"Mechanical Characteristics of Steel 35 as a Function of the Low Temperature Stretching Rate"

Kiev, Fiziko-Khimicheskaya Mekhanika Materialov, Vol 6, No 2, 1970, pp 30-37

Abstract: This article contains the results of investigation of medium carbon steel 35 in the temperature range of 77-300°K with variation of the loading rate from static to impact with ($\gamma=6-21 \cdot 10^4$ kilogram-force/ $\text{mm}^2 \cdot \text{sec}$). The mechanical properties of metals with body-centered cubic lattices, including the majority of construction materials, are highly sensitive to temperature changes and deformation rates at low homologic temperatures. Investigation of these relations is important not only in determining the workability of the material but also in studying brittle fracture and the mechanism of plastic flow which is not complicated by diffusion and recrystallization processes under these conditions. The stress-strain diagrams constructed on the basis of the oscillograms are presented. The nature of the diagrams changes comparatively little with an increase in the deformation rate. For a small $\dot{\epsilon}$ the rate curves are above the static curve; then with an increase in $\dot{\epsilon}$ the rate curves approach the static curve and at negative temperatures they even intersect it. Intersection takes place faster the lower

the temperature. Reducing the temperature has the sharpest effect on the form of the diagram: the diagrams go up and down especially at temperatures below 170°K. At 77°K and a maximum deformation rate, the nature of the diagram becomes standard for brittle fracture.

Analysis of the set of diagrams shows that the experimental values of all the mechanical characteristics can be plotted well on straight lines (part of the straight lines are presented in Figure 3) corresponding to the linear relations for these values as functions of the logarithm of the elastic or plastic deformation rate. The slope of these lines increases with a decrease in temperature to 158°K, which indicates an increase in sensitivity to the deformation rate.

The data show that the temperature dependence of the mechanical characteristics is appreciably stronger than the rate dependence. The intensity of growth of the yield point and ultimate strength increases as the temperature is lowered. In the temperature range of 140-160°K the following qualitative changes take place: the elongation per unit length and reduction of area are reduced, the true rupture strength reaches a maximum, an inflection is observed on the yield point rate curve, and the conical section disappears in the fracture. The law of variation of the upper yield point is also analyzed. An analytical expression is

presented for determining the upper yield point based on the described laws.
Results obtained earlier by various authors are discussed in the light of the new
data.

"Effect of Nonmetallic Inclusions on the Impact Strength of Low-Carbon Steel"

Moscow, Metallovedeniye, No 5, May 70, pp 58-60

Abstract: Steel 20 was melted so as to produce specific types of inclusions: lamellar (unsaturated) silicates, aluminum oxide, silicon dioxide, and titanium nitrides. The chemical composition of all heats was in the following ranges (%): 0.19-0.21 C, 0.21-0.23 Si, 0.35-0.37 Mn, 0.1 Cr, 0.16 Ni, 0.011-0.012S, 0.010-0.012 P, and less than 0.01 N. Hydrogen and oxygen content varied from 0.00010-0.00034% and 0.0048-0.022% respectively. Mechanical properties were affected only slightly by the inclusions and had the following values: $10446-13 \text{ kg/mm}^2$, $19-27-29 \text{ kg/mm}^2$, elongation--33-35%, reduction in area--66-68.5%, and impact strength--14-16.5 kg/mm^2 . Standard impact test specimens were used for testing.

It was found that the durability of longitudinal samples was better than for transverse samples and at negative temperatures the fatigue strength is greater than at room temperature. The poorest durability was found in samples which had lamellar silicate inclusions in the grain boundaries. The durability of samples
